***Test Conditions / Notes:***

The EUT is seeking modular approval and is placed in the center of the turntable on a Styrofoam table 80cm above the ground plane, installed on a support host PCB as intended for final installation. The laptop located outside the chamber sends test command to the EUT via the support host PCB. The EUT is set in constant transmit mode.

Freq: 902.75MHz, 915.25MHz, 927.25MHz

Measured Power= 23.0dBm, 23.0dBm, 22.6dBm

Firmware setting = 23dBm, 23dBm, 23dBm

Emission profile evaluated with Mini Guardrail Antenna -20dBi with a 30cm cable between EUT and the antenna.

Frequency range of measurement = 9 kHz- 10 GHz.

9 kHz -150 kHz;RBW=200 Hz=VBW

150 kHz-30 MHz;RBW=9 kHz=VBW

30 MHz-1000 MHz;RBW=120 kHz=VBWz,

1000 MHz-10,000 MHz;RBW=1 MHz=VBW

15.31(e) compliance: a freshly charged battery is installed

Emission profile of the EUT rotated along three orthogonal axes was investigated. Recorded data represent worse case emission.

Test method in accordance with FCC document: DA 00-705.

Temperature: 24°C

Pressure: 101.5kPa

Humidity: 37%

**Equipment Under Test (\* = EUT):**

Function	Manufacturer	Model #	S/N
Impinj IPJ-RS500 23dBm Reader SIP*	Impinj Inc.	IPJ-RS500GX	
Antenna	Laird Technologies	S9025PR	

**Support Devices:**

Function	Manufacturer	Model #	S/N
Development platform	Impinj, Inc.	IPJ-E4000 Rev 2.01	
Battery	Tenergy	18650	
Battery Pack	Tenergy	TN270	
Battery	Tenergy	18650	

**Test Conditions / Notes:**

The EUT is seeking modular approval is placed in the center of the turntable on a Styrofoam table 80cm above the ground plane , installed on a support host PCB as intended for final installation. The laptop located outside the chamber sends test command to the EUT via the support host PCB. The EUT is set in constant transmit mode.

Freq: 902.75MHz, 915.25MHz, 927.25MHz

Measured Power= 23.0dBm, 23.0dBm, 22.6dBm

Firmware setting = 23dBm, 23dBm, 23dBm

Emission profile evaluated with Laird Antenna 5.5dBi with a 30cm cable between EUT and the antenna

Frequency range of measurement = 9 kHz- 10GHz.

9 kHz -150 kHz;RBW=200 Hz=VBW

150 kHz-30 MHz;RBW=9 kHz=VBW

30 MHz-1000 MHz;RBW=120 kHz=VBWz,

1000 MHz-10,000 MHz;RBW=1 MHz=VBW

15.31(e) compliance: a freshly charged battery is installed

Emission profile of the EUT rotated along three orthogonal axes was investigated. Recorded data represent worse case emission.

Test method in accordance with FCC document: DA 00-705

Temperature: 24°C

Pressure: 101.5kPa

Humidity: 37%

***Test Conditions / Notes:***

The EUT is seeking modular approval and is placed in the center of the turntable on a Styrofoam table 80cm above the ground plane, installed on a support host PCB as intended for final installation. The laptop located outside the chamber sends test command to the EUT via the support host PCB. The EUT is set in constant transmit mode.

Freq: 902.75MHz, 915.25MHz, 927.25MHz

Measured Power= 23.0dBm, 23.0dBm, 22.6dBm

Firmware setting = 23dBm, 23dBm, 23dBm

Emission profile evaluated with Mini Guardrail Antenna -20dBi with a 30cm cable between EUT and the antenna.

Frequency range of measurement = 9 kHz- 10 GHz.

9 kHz -150 kHz;RBW=200 Hz=VBW

150 kHz-30 MHz;RBW=9 kHz=VBW

30 MHz-1000 MHz;RBW=120 kHz=VBWz,

1000 MHz-10,000 MHz;RBW=1 MHz=VBW

15.31(e) compliance: a freshly charged battery is installed.

Emission profile of the EUT rotated along three orthogonal axes was investigated. Recorded data represent worse case emission.

Test method in accordance with FCC document: DA 00-705.

Temperature: 24°C

Pressure: 101.5kPa

## SUPPLEMENTAL INFORMATION

### Measurement Uncertainty

Uncertainty Value	Parameter
4.73 dB	Radiated Emissions
3.34 dB	Mains Conducted Emissions
3.30 dB	Disturbance Power

The reported measurement uncertainties are calculated based on the worst case of all laboratory environments from CKC Laboratories, Inc. test sites. Only those parameters which require estimation of measurement uncertainty are reported. The reported worst case measurement uncertainty is less than the maximum values derived in CISPR 16-4-2. Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k=2. Compliance is deemed to occur provided measurements are below the specified limits.

### Emissions Test Details

#### TESTING PARAMETERS

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

#### CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in dB $\mu$ V/m, the spectrum analyzer reading in dB $\mu$ V was corrected by using the following formula. This reading was then compared to the applicable specification limit.

<b>SAMPLE CALCULATIONS</b>	
Meter reading	(dB $\mu$ V)
+ Antenna Factor	(dB)
+ Cable Loss	(dB)
- Distance Correction	(dB)
- Preamplifier Gain	(dB)
= Corrected Reading	(dB $\mu$ V/m)

#### **TEST INSTRUMENTATION AND ANALYZER SETTINGS**

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

<b>MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE</b>			
TEST	BEGINNING FREQUENCY	ENDING FREQUENCY	BANDWIDTH SETTING
CONDUCTED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	9 kHz	150 kHz	200 Hz
RADIATED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	30 MHz	1000 MHz	120 kHz
RADIATED EMISSIONS	1000 MHz	>1 GHz	1 MHz

#### **SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS**

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or carrot ("") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

##### **Peak**

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

##### **Quasi-Peak**

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

##### **Average**

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point the measuring device is set into the linear mode and the scan time is reduced.
